

NEBRASKA ARBOVIRUS SURVEILLANCE AND MOSQUITO MONITORING PROGRAM 2018 UPDATE #5

Date: 07/13/2018. Please note that mosquito collection data covers dates 06/24/2018 to 07/07/2018 (CDC Weeks 26 and 27). Bird, human, and equine surveillance may include data from beyond these dates. All data is provisional and may change.

SUMMARY

- **Climate:** Over the past 30 days (dates 06/08/2018 to 07/07/2018), precipitation has ranged from 1.0 to >9.5 inches across the state. The heavier amounts were located in northeastern Nebraska. For the last 30 days (date ending 07/07/2018), rainfall was above normal over a large area of the state and below normal in portions of southeast, southwest, and western Nebraska. Average temperatures for the last 30 days (date ending 07/07/2018) were above normal over central, eastern, and southern Nebraska with areas in the northern and western part of the state seeing near normal temps. Per the United States Drought Monitor, recent rains have resulted in removal of nearly all abnormally dry and moderate drought conditions in Nebraska. Only a small area in far southeastern Nebraska remains with abnormally dry and moderate drought conditions.
- **Three Month Forecast:** For July 2018 to September 2018, the NOAA outlook is predicting an elevated probability of above normal temperatures across Nebraska and equal chances of above or below normal precipitation over most of the state.
- **Mosquito Numbers- Eastern Nebraska:** Individual county collections for the reported two weeks of sampling ranged from “low” to “extremely high” based on historical county data. Overall in the east region, activity has responded to recent rains. While only considered “moderate” based on historical data from regional traps, this was nearly a 3-fold increase from last week’s report! *Aedes vexans* (Inland floodwater mosquito) was the most abundantly collected mosquito from CDC light traps (61.8%) in the region. *Culex* mosquito (primary vectors of West Nile virus) counts saw a slight increase in numbers but remained “low” based upon historical regional data with individual county collections ranging from “low” to “very high”. *Culex tarsalis* made up the majority of captured *Culex*, accounting for 63.2% of collections over the two week sampling period. Eighteen invasive *Aedes albopictus* (Asian tiger mosquito) were collected from the region. All specimens were collected from Richardson County at trap sites that have produced *Aedes albopictus* historically.

- **Mosquito Numbers- Central Nebraska:** Individual county collections for the reported two weeks of collecting ranged from “low” to “very high” based on historical data. Like the eastern region, the central region numbers have responded to previous rains. Overall counts are now considered “moderate” representing a nearly 2-fold increase in mosquitoes per trap night compared to the previous report. *Aedes vexans* was the most collected mosquito (63.8%) from region traps. *Culex* mosquito counts increased slightly but were “low” based upon historical regional data, with counts ranging from “low” to “very high” based upon their historical data. *Culex tarsalis* made up the majority of the collected *Culex*, accounting for 94.2% of collections over the sampling period. No invasive *Aedes albopictus* were collected from the region.
- **Mosquito Numbers- Western Nebraska:** Individual county collections for the reported two weeks ranged from “low” to “very high” compared to their historical data. Overall mosquito activity from regional traps followed what was seen in the other two regions with increases in mosquito numbers due to recent rains. Counts were considered “moderate” but saw a >2-fold increase compared to the previous two week period. *Aedes vexans* was the most abundant mosquito collected in CDC light traps (73.1%) during the two week period. *Culex* mosquito counts remained “low” based upon historical regional data, but did see a >3-fold increase compared to the last two week sampling period. Individual counts across counties in the west region were mostly “low” with two counties reporting “high” numbers and one county with “moderate” numbers based upon their historical data. *Culex tarsalis* made up the majority of captured *Culex* accounting for 99.0% of collections over the sampling period. No invasive *Aedes albopictus* were collected from the region.
- **Arboviral Detections:** Over the two weeks of mosquito surveillance covered in this report, no new positive West Nile virus (WNV) *Culex* mosquito pools were detected from mosquito samples. **Positive mosquito pools** have been detected previously during the season and demonstrate that WNV is circulating in the environment among mosquitoes. To date 493 *Culex* pools have been tested with two positives detected to date. The current WNV cumulative statewide minimum mosquito infection rate (0.37/1,000 *Culex*) is below the 10-year median (0.42/1,000 *Culex*) for this time of year. No positive pools for St. Louis Encephalitis (SLE) or Western Equine Encephalitis (WEE) viruses were detected over the two weeks and zero have been detected for the season.
- **Dead Bird Surveillance:** To date 49 birds have been reported. Of the 49 birds reported, seven have been a corvid birds (bird group most heavily impacted by WNV and includes: blue jays, crows, and magpies). Three birds reported have met criteria for testing of WNV with one negative, one bird unsuitable for testing, and one result pending.
- **Equine Surveillance:** Currently no equine cases of WNV have been reported for the season.
- **Human Mosquito-borne Disease Cases:** **Two human clinical WNV cases** have currently been reported in a Nebraska residents. Additionally, a total of four travel-related mosquito-borne disease have occurred in state residents: three malaria cases and one dengue case.

Comment: *The second human clinical (symptomatic) WNV case has been reported in a Nebraska resident and positive WNV mosquito pools have been detected from mosquito samples. WNV is circulating in the environment and individuals should take proper mosquito prevention activities to reduce mosquito bites! As we get further into the summer season, risk of WNV will increase. Additionally, four travel-related mosquito-borne illness cases, three malaria and one dengue case, have been reported in Nebraska residents returning from overseas travel. Individuals are strongly encouraged to practice proper mosquito prevention anytime mosquitoes are present or likely to be present no matter where they are to decrease their chances of acquiring a mosquito-borne illness.* Statewide, mosquito collections from CDC light traps increased significantly with the statewide average seeing “moderate” counts when compared to historical data, averaging 156.98 total mosquitoes per trap night. This was a >2-fold increase compared to the previous two week sampling period. Rain events over recent weeks have seen mosquito counts respond to the moisture with all three regions seeing significant increases in

mosquito activity compared to the previous sampling period. The most abundant mosquito collected over the two week sampling period was Nebraska's most common mosquito, *Aedes vexans*, accounting for 67.0% of trap collections. *Culex* mosquito counts statewide also saw a substantial increase (nearly 2-fold), but were still below average in all three regions and considered "low" based on historical data, averaging 16.88 *Culex* per trap night. *Culex tarsalis* (primary WNV vector in Nebraska), was the most collected *Culex* mosquito (89.4%) during the two week period.

ENVIRONMENTAL CONDITIONS

Environmental and climate conditions can impact mosquito-borne diseases by influencing mosquito numbers and mosquito infection prevalence. For example, drought has been identified as a primary driver of WNV epidemics. This is why rainfall, temperature, and drought conditions are monitored closely during the mosquito surveillance season.

Rainfall and Temperature

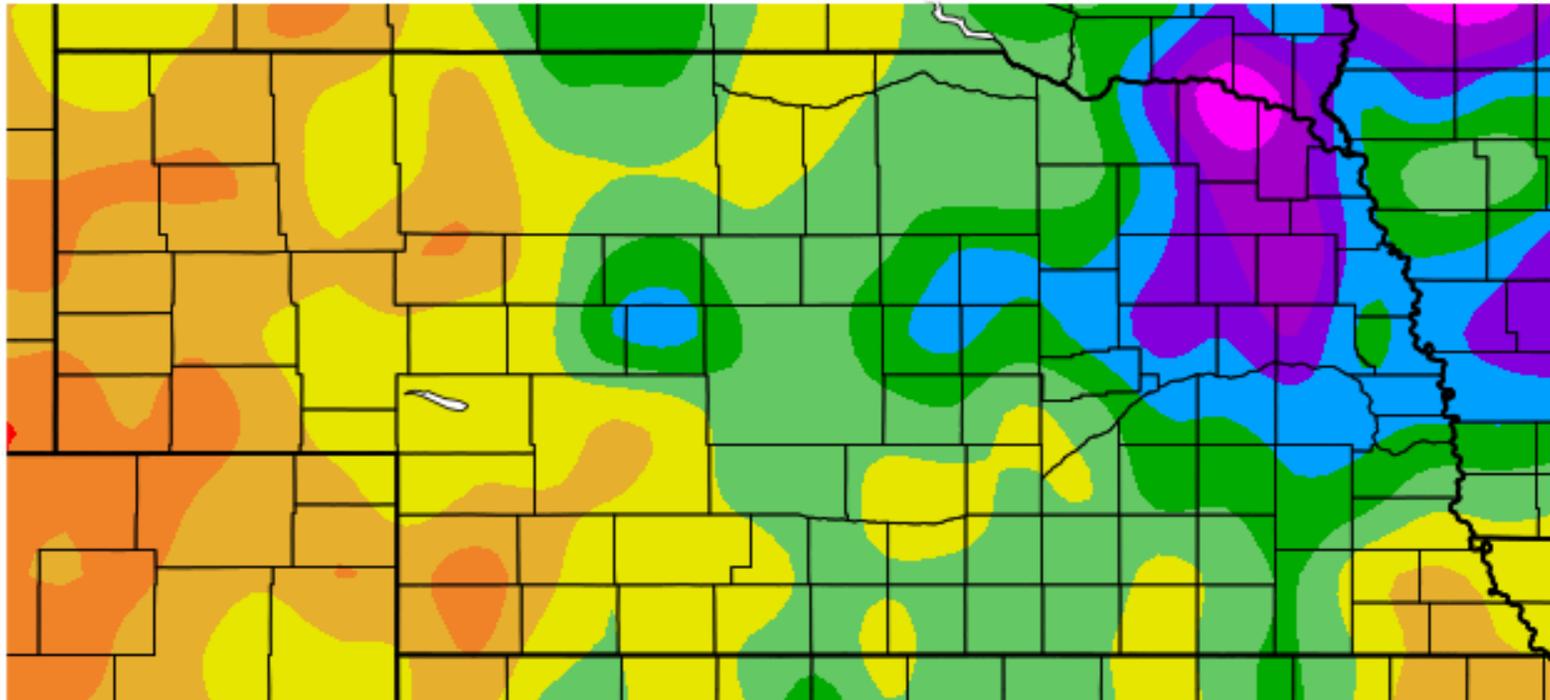

Rainfall across Nebraska over the last 30 days (06/08/2018 to 07/07/2018) ranged from 1.0 to >9.5 inches (pg. 4) across the state. The heavier amounts were located in northeastern Nebraska. For the last 30 days (date ending 07/07/2018), rainfall was well above normal over a large area of Nebraska and below normal in portions of southeast, southwest, and western Nebraska (pg.5). Average temperatures (pg. 6) for the last 30 days were above normal over most of central, eastern, and southern Nebraska with northern and western areas of the state seeing near normal temps. Over the next 8 to 14 days (as of 07/08/2018), the extended forecast is predicting an equal probability of above and below normal temperatures for most of the state, while precipitation is predicted to have an elevated probability of below normal precipitation over most of Nebraska. More climate and forecast information can be found at:

Three Month Temperature and Rainfall Forecast

For July 2018 to September 2018, forecast predictions for Nebraska are for an elevated probability of above normal temperature over most of the state and equal chances for above and below normal precipitation. Links for the pages containing graphics of the long-term outlook can be found here:

http://www.cpc.ncep.noaa.gov/products/predictions/long_range/seasonal.php?lead=1 (Temperature and Rainfall Outlook).

Drought Outlook

The current drought monitor on page eight (through 07/10/2018) is reporting approximately 98.73% of the state with no drought or abnormally dry conditions. The monitor report shows recent rains have resulted in removal of abnormally dry and moderate drought conditions over most of Nebraska. Only a small area in far southeaster Nebraska remains with abnormally dry and moderate drought conditions. Currently the land area in the state encompassing abnormal dryness is approximately 0.43% and moderate drought around 0.83% (0.84% last week) of the state area. Last year at this time, 28.19% of the state area reported no drought or abnormally dry conditions per the drought monitor. The current monthly drought outlook for July can be found on page nine. U.S. Monthly Drought Outlook

Drought Tendency During the Valid Period

Valid for July 2018
Released June 30, 2018

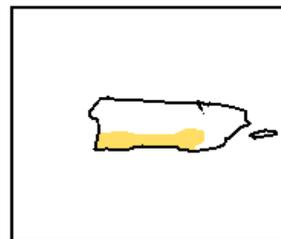

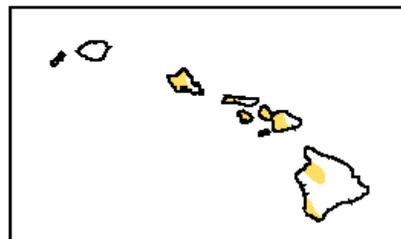

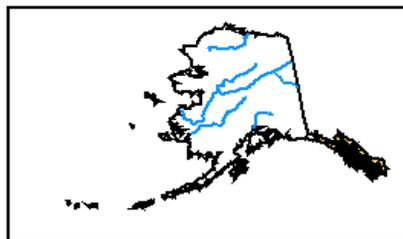

Depicts large-scale trends based on subjectively derived probabilities guided by short- and long-range statistical and dynamical forecasts. Use caution for applications that can be affected by short lived events. "Ongoing" drought areas are based on the U.S. Drought Monitor areas (intensities of D1 to D4).

NOTE: The tan areas imply at least a 1-category improvement in the Drought Monitor intensity levels by the end of the period, although drought will remain. The green areas imply drought removal by the end of the period (D0 or none).

-  **Drought persists**
-  **Drought remains but improves**
-  **Drought removal likely**
-  **Drought development likely**

ARBOVIRAL DETECTIONS

To date, there has been two positive arbovirus positive mosquito pools detected in two different counties. The statewide WNV cumulative mosquito minimum infection rate (MIR) per 1,000 *Culex* decreased and is 0.37 which is low overall and below the 10-year median of 0.42 for this time of year.

Table 1. Arboviral Detections

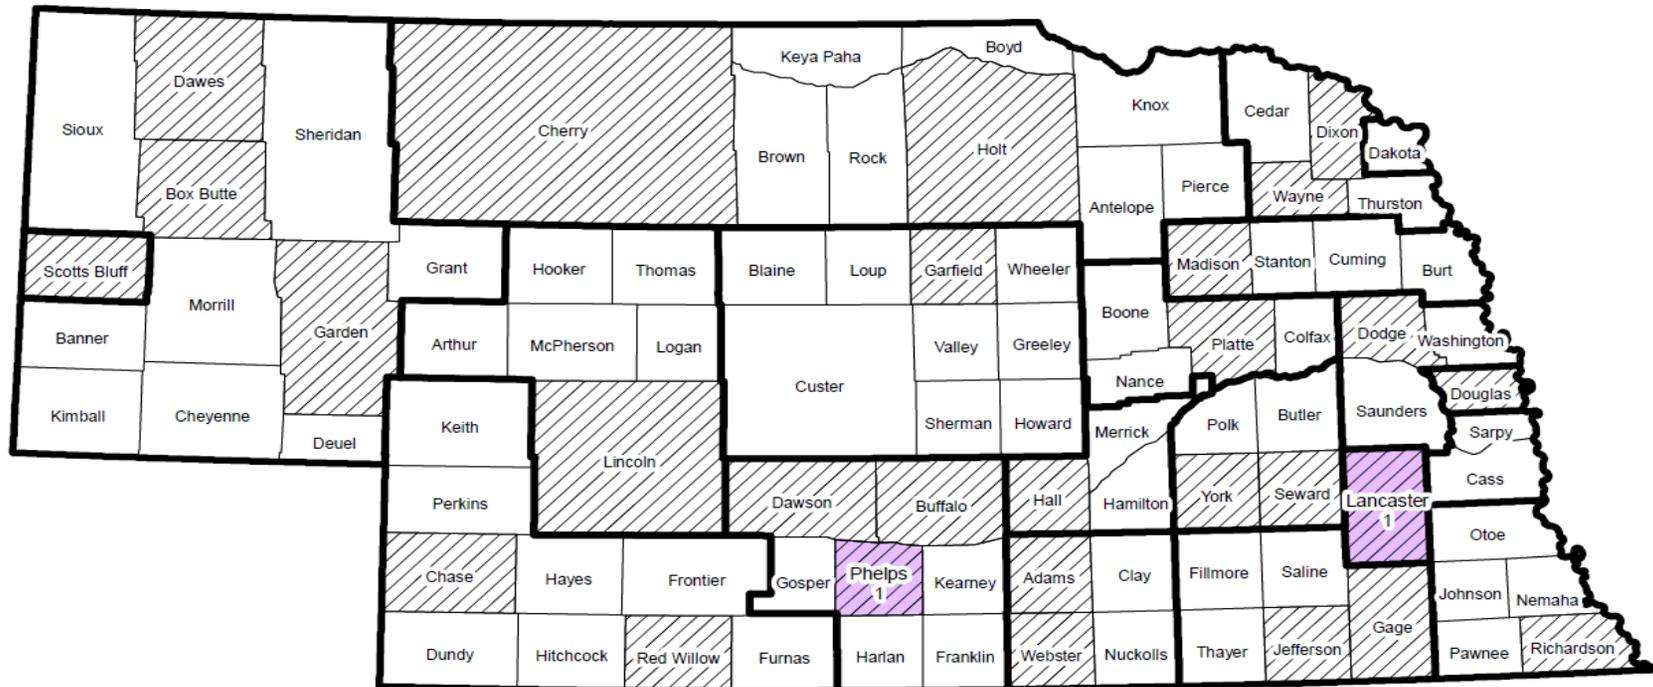

Date Collected	County	Mosquito Species	Virus
6/6/2018	Phelps	<i>Culex tarsalis</i>	WNV
6/7/2018	Lancaster	<i>Culex pipiens</i>	WNV

Figure 1. Positive mosquito pools in the Nebraska CDC light trap network, 2018.

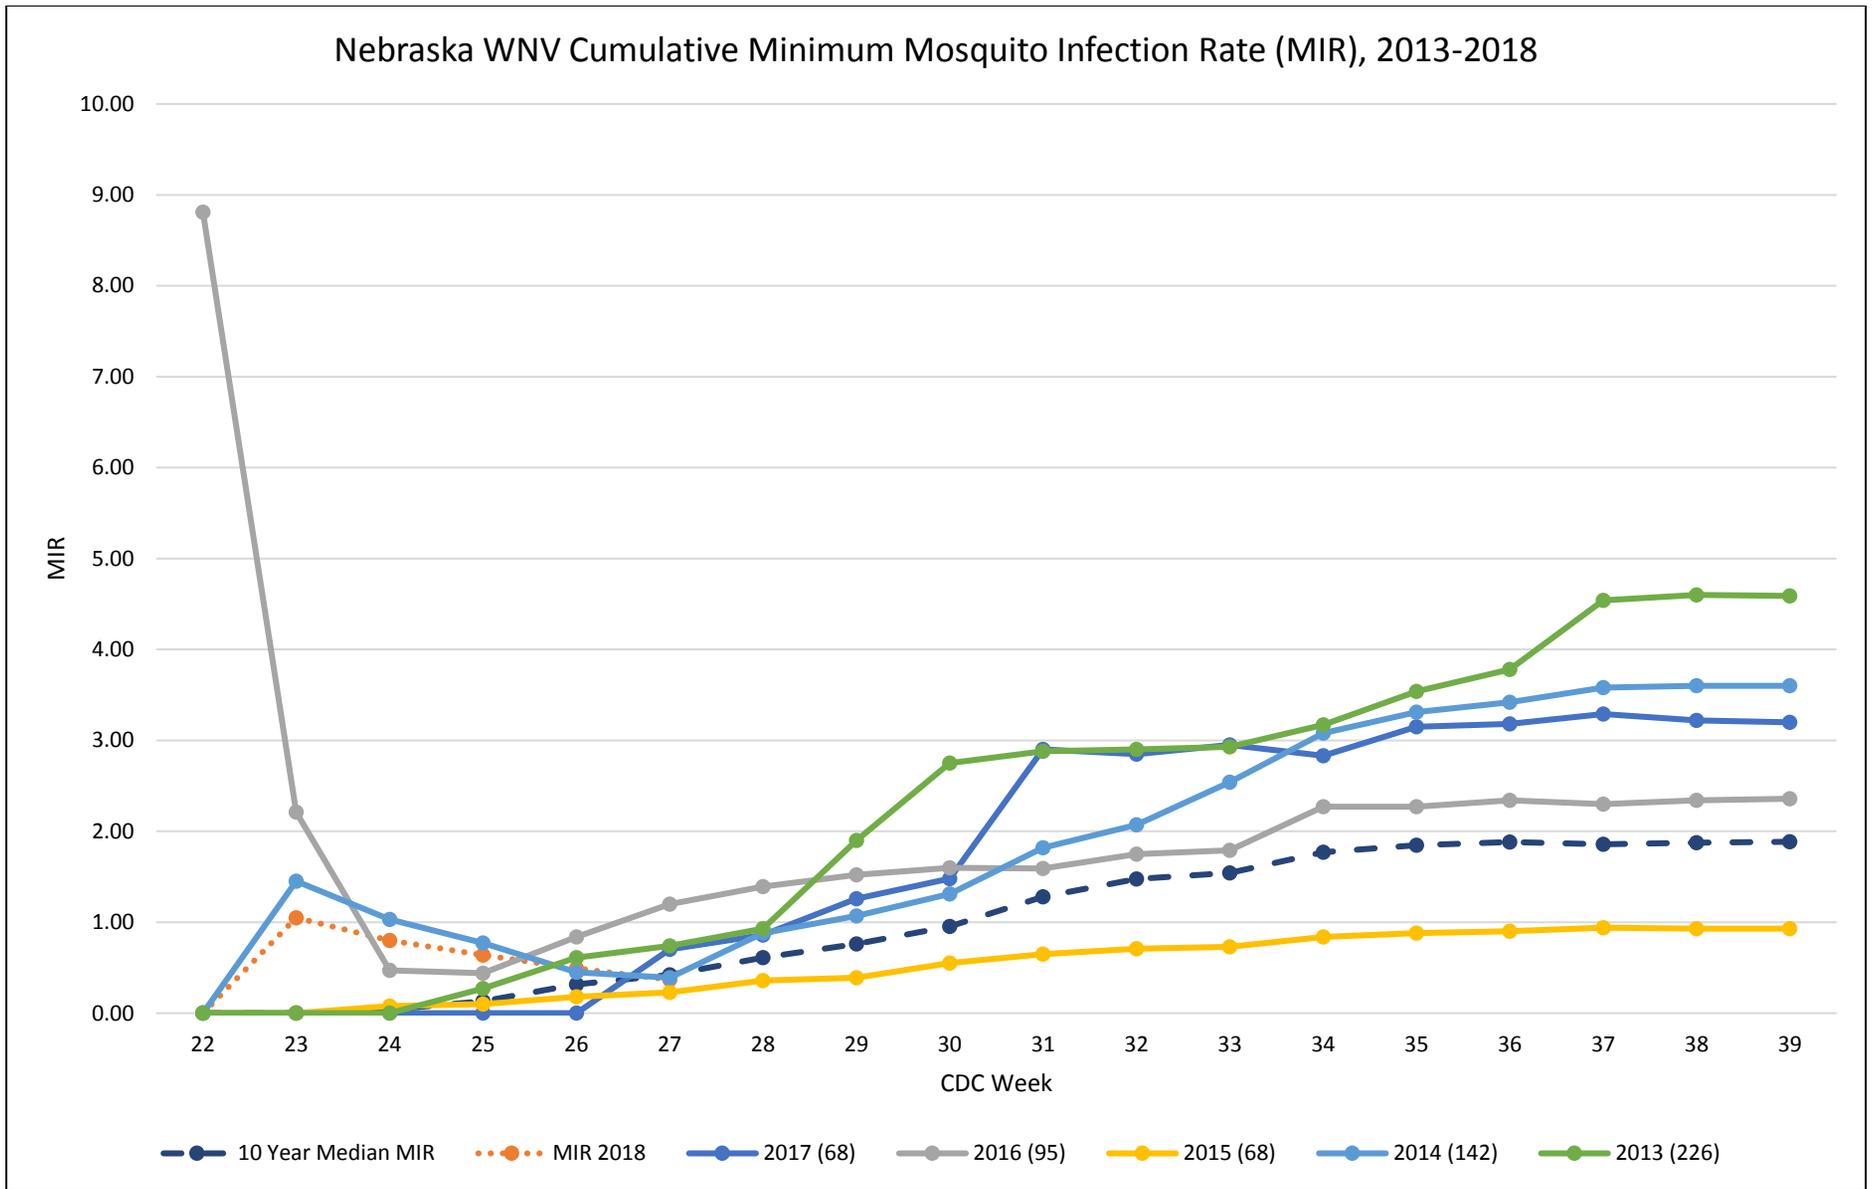

Figure 2. Weekly Nebraska WNV Mosquito Cumulative Mosquito Minimum Infection Rate, 2013-2018. At the state level, the calculated statewide MIR is strongly correlated with the number of human clinical WNV cases. As such, comparisons during the season of the weekly cumulative MIR with previous seasons' cumulative MIRs may give an indication as to how severe a WNV season might be. Please note 2018 data is shown as a dotted line and the 10-year median as a dashed line. Numbers in parentheses next to years indicate the number of human WNV clinical cases reported that year.

**HUMAN MOSQUITO-BORNE DISEASE
CASES**

Weekly reported cases (confirmed and probable) of human clinical mosquito-borne disease infections in Nebraska residents is summarized in the table below (pg. 13 and 14). It includes human infections of West Nile virus (WNV), St. Louis Encephalitis virus (SLE), Western Equine Encephalitis virus (WEE), chikungunya (CHIKV), dengue (DENV), Zika, and malaria. Please note that cases are by earliest report date of infection not necessarily by date of onset. Table only includes reported cases that had exposure or onset of disease in 2018. All data is preliminary and may change as more information is received.

^These are endemic viruses that have been historically transmitted by mosquitoes in Nebraska and maybe acquired within the state. It should be noted that reports are for Nebraska residents and that infection may have been acquired elsewhere. *These diseases are typically acquired via travel overseas to areas where the virus or parasite is endemic. Currently, Nebraska does not have local transmission via mosquitoes of these organisms and the probability of local transmission by local mosquitoes is thought to be very low and not expected. However, to further lower and prevent the chance of local transmission of these “travel-related” diseases, returning travelers or visitors from these areas should prevent mosquito bites for at least three weeks upon arrival to Nebraska. Additionally, although cases of CHIKV, DENV, and ZIKA are most often acquired via overseas travel, small areas of transmission and small, local outbreaks within the U.S. have occurred and may occur in the future. Examples of states that have seen local transmission include: Florida, (DENV, CHIKV, and ZIKA), Hawaii (DENV), and Texas (DENV, CHIKV, and ZIKA).

Comment: WNV is the most widespread, locally acquired mosquito-borne disease in Nebraska. The state has one of the highest incidences of WNV in the U.S. and the virus is highly endemic to the state. **Two human clinical cases have been reported in Nebraska residents to date.** Additionally, **two positive WNV mosquito pools have been detected indicating WNV is circulating in the environment.** Overall WNV risk will continue to increase as we move through the summer months. It is important to note that there are many factors that come into play in determining an individual person's risk of acquiring WNV and other mosquito-borne diseases. **Low WNV activity or no WNV activity detected DOES NOT mean NO RISK!** For travel related mosquito-borne diseases, three cases of malaria (South Sudan= 1 and Togo= 2) and on case of dengue (Thailand= 1) have been reported this year. Anytime mosquitoes are active there is always the possibility of acquiring WNV or another mosquito-borne arbovirus and proper mosquito prevention methods should be utilized both here at home and when traveling abroad. Examples include:

- Applying an EPA approved mosquito repellent (DEET, picaridin, oil of lemon eucalyptus, or IR3535).
- Limiting exposure when outdoors by wearing long sleeve shirts and pants.
- Limiting time spent outdoors when mosquitoes are most active, typically dusk to midnight.
- Getting rid of standing water that mosquitoes may breed in at least once a week. Remember to change water in outdoor pet watering dishes along with bird baths and dump out water in flower pots, garden containers, or other objects that may hold water.

MOSQUITO RESULTS

The Nebraska CDC light trap network consists of 143 traps set across the state to monitor mosquito populations and test for the presence of arboviruses circulating in the state’s mosquito populations.

Total mosquito and *Culex* mosquito counts from CDC light traps are described in relative terms based on individual historical county data and are depicted in the tables below:

0 to 40th percentile	41st to 60th percentile	61st to 80th percentile	81st to 97th percentile	>97th percentile
Low	Mod.	High	Very High	Extremely High

The individual county mosquito trapping data for the final trap period can be found on pg. 23-24.

Each county or region represents the average for all CDC light trapping sites in that county or region. ND= No Data.

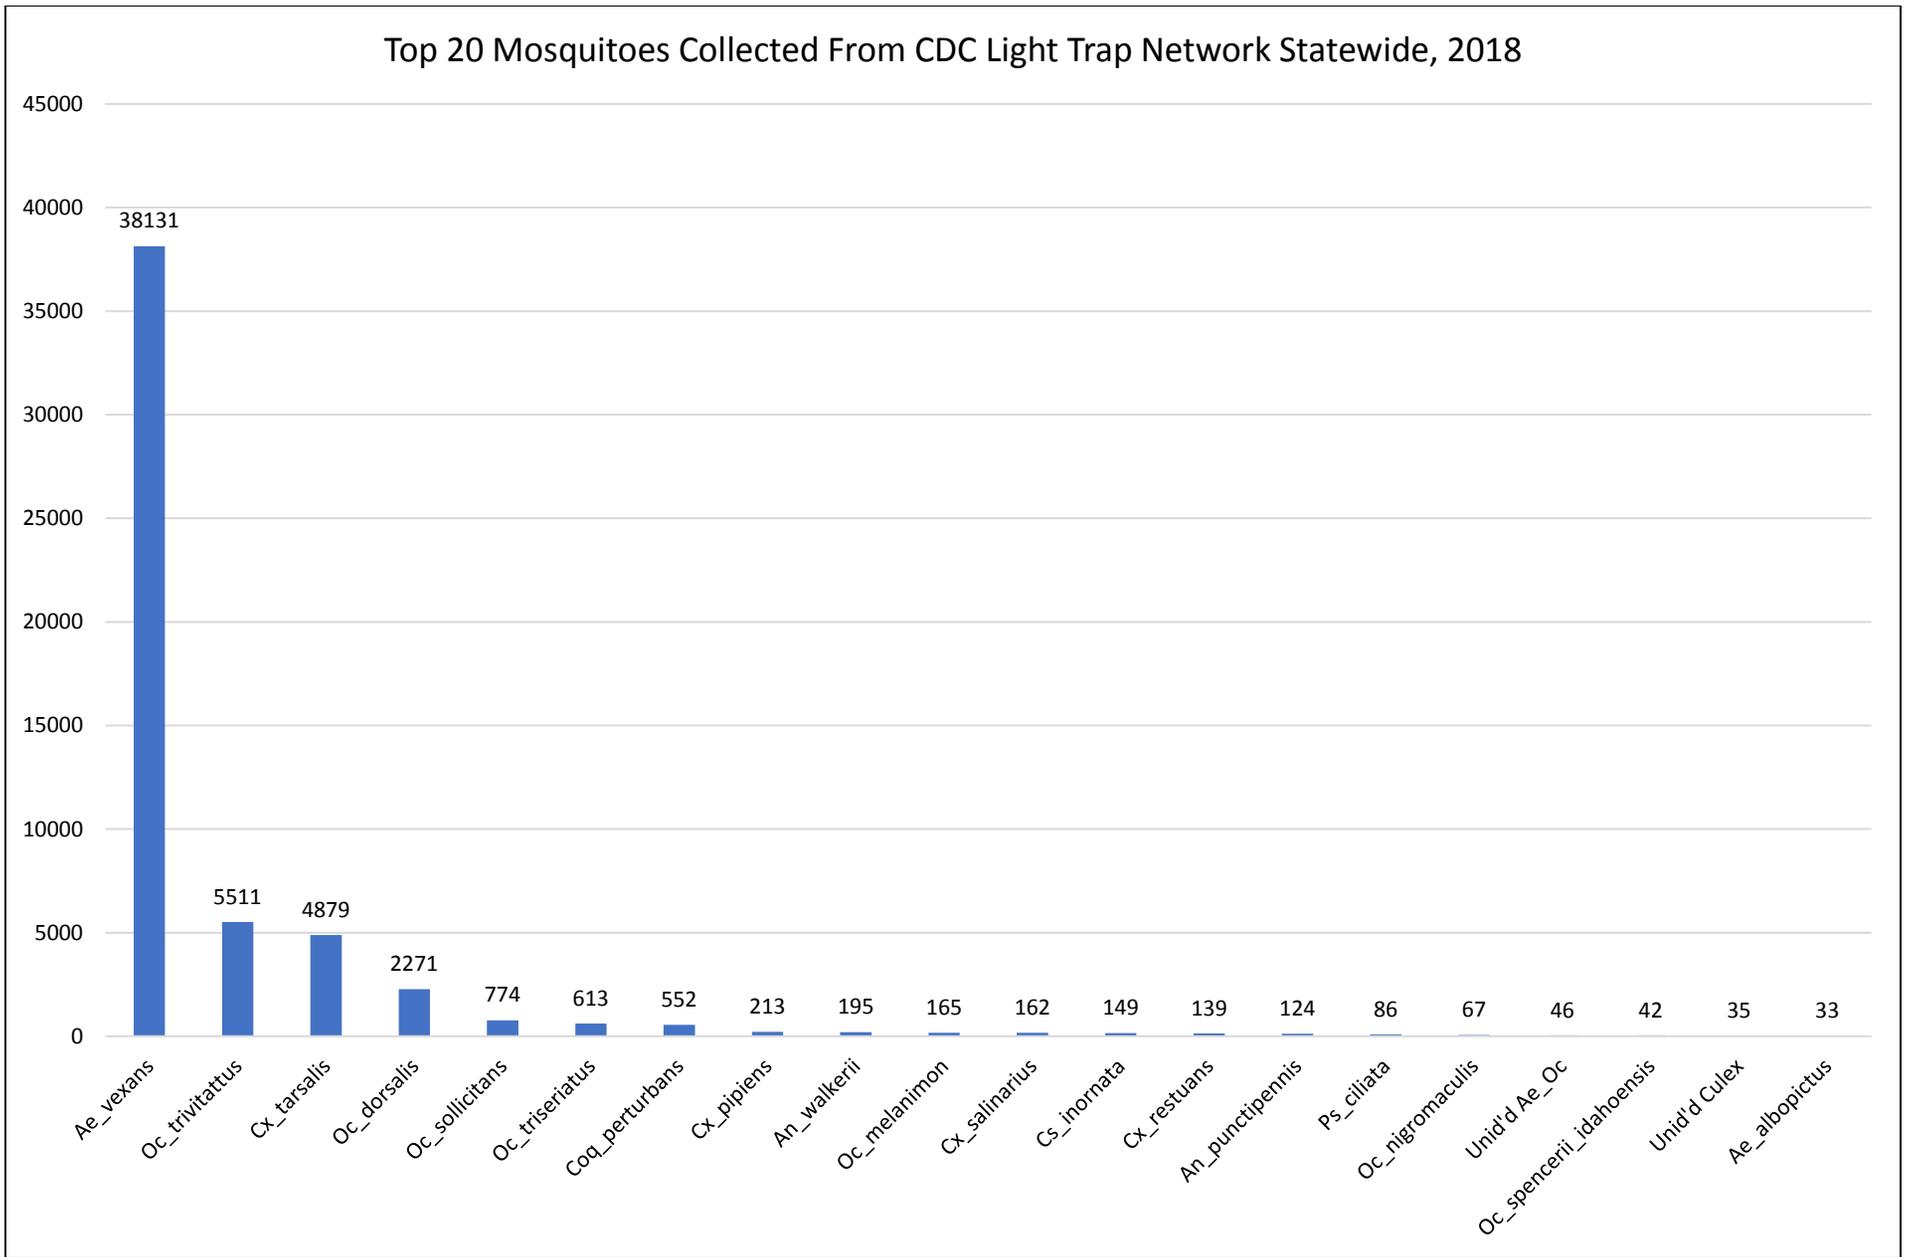

Figure 7. Top 20 cumulative mosquitoes collected statewide from CDC light trap network, 2018. Note that the first part of the mosquito species name has been abbreviated. Ae= *Aedes*, An= *Anopheles*, Cs= *Culesita*, Cx= *Culex*, Oc= *Ochlerotatus*, Ps= *Psorophora*, Unid'd= Unidentified.

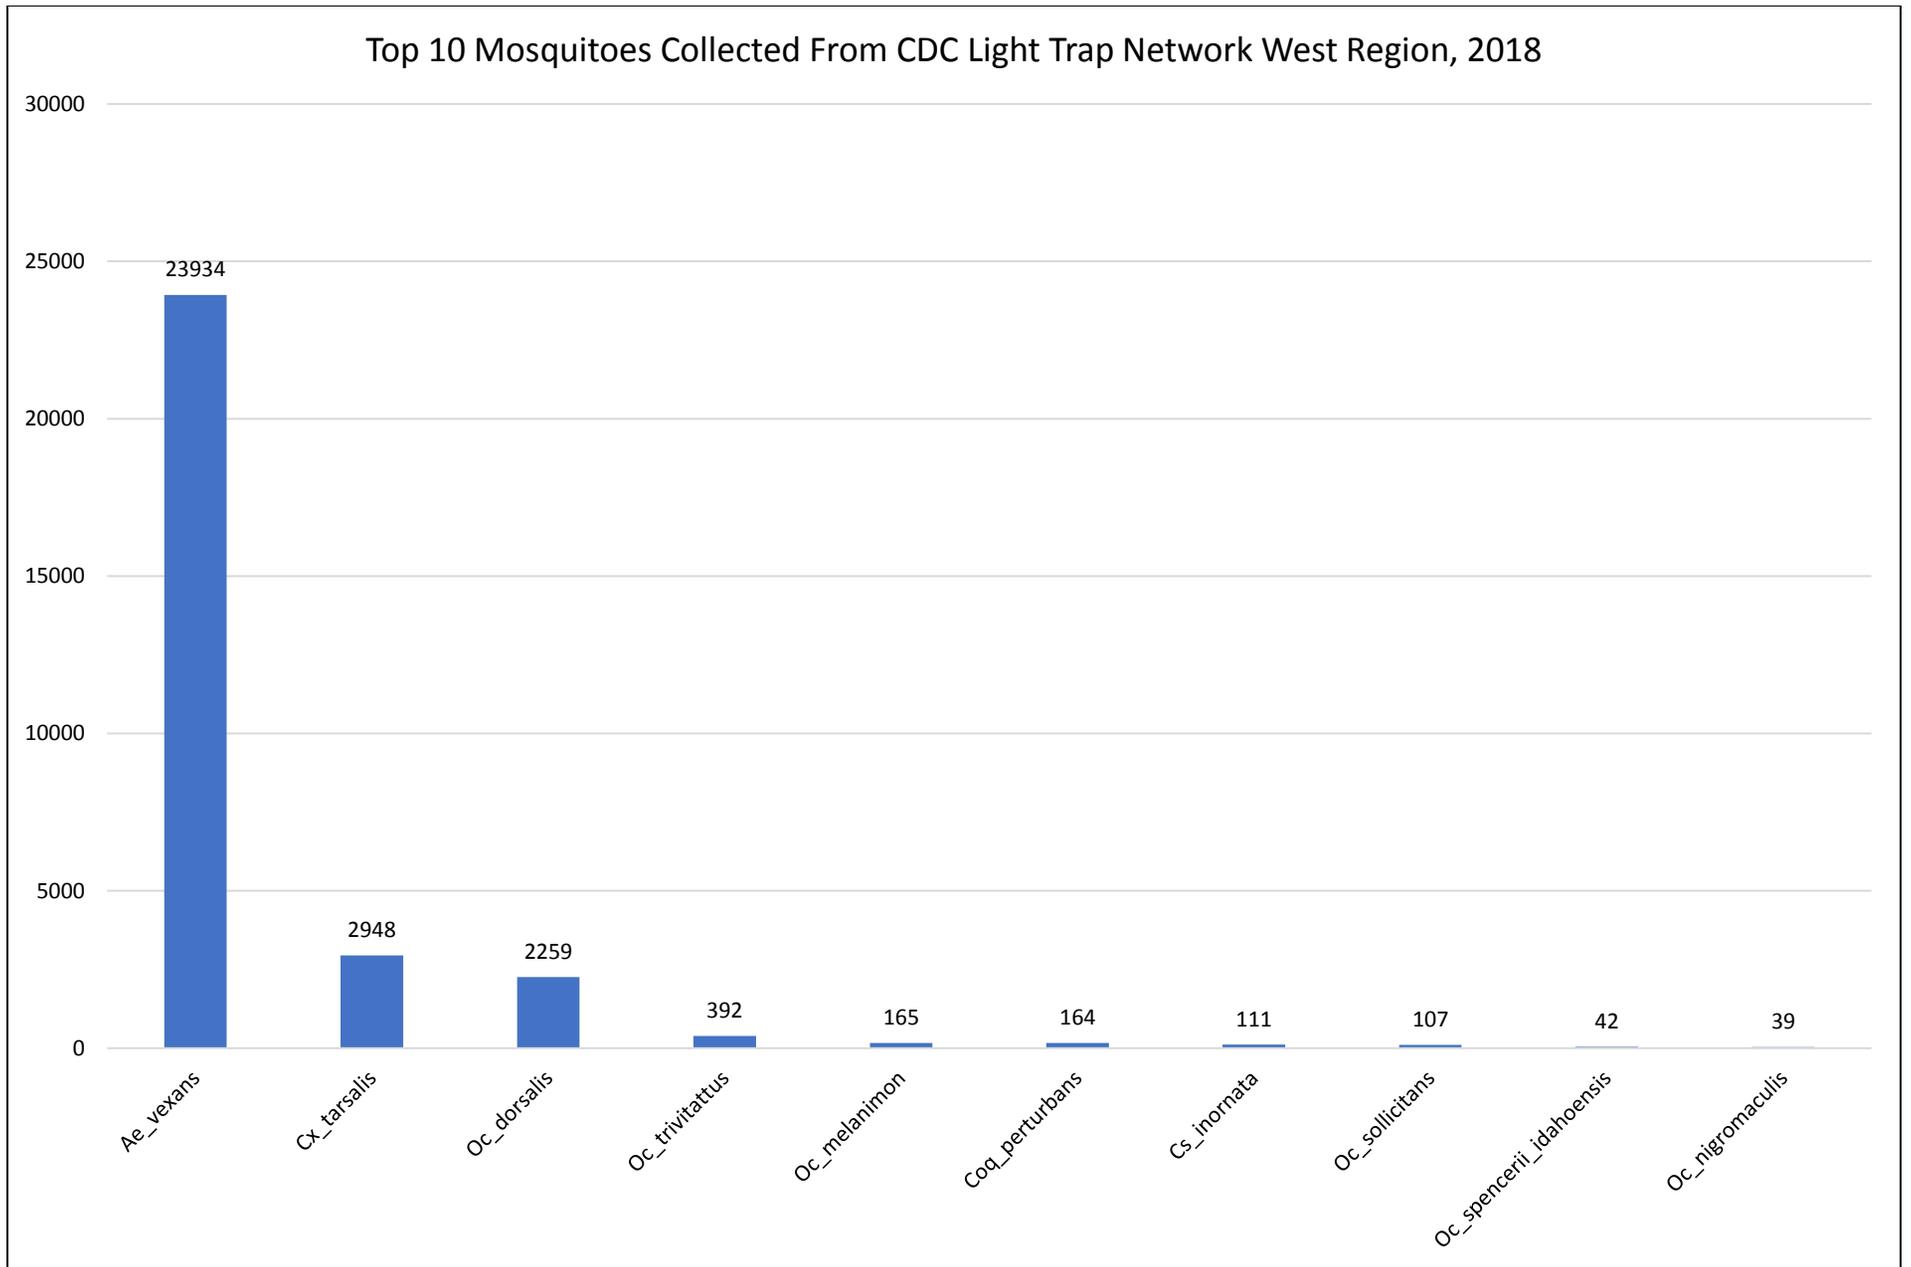

Figure 8. Top 10 cumulative mosquitoes collected in West region of the state from CDC light trap network, 2018. Note that the first part of the mosquito species name has been abbreviated. Ae= *Aedes*, An= *Anopheles*, Cs= *Culesita*, Cx= *Culex*, Oc= *Ochlerotatus*, Ps= *Psorophora*, and Unid'd= Unidentified.

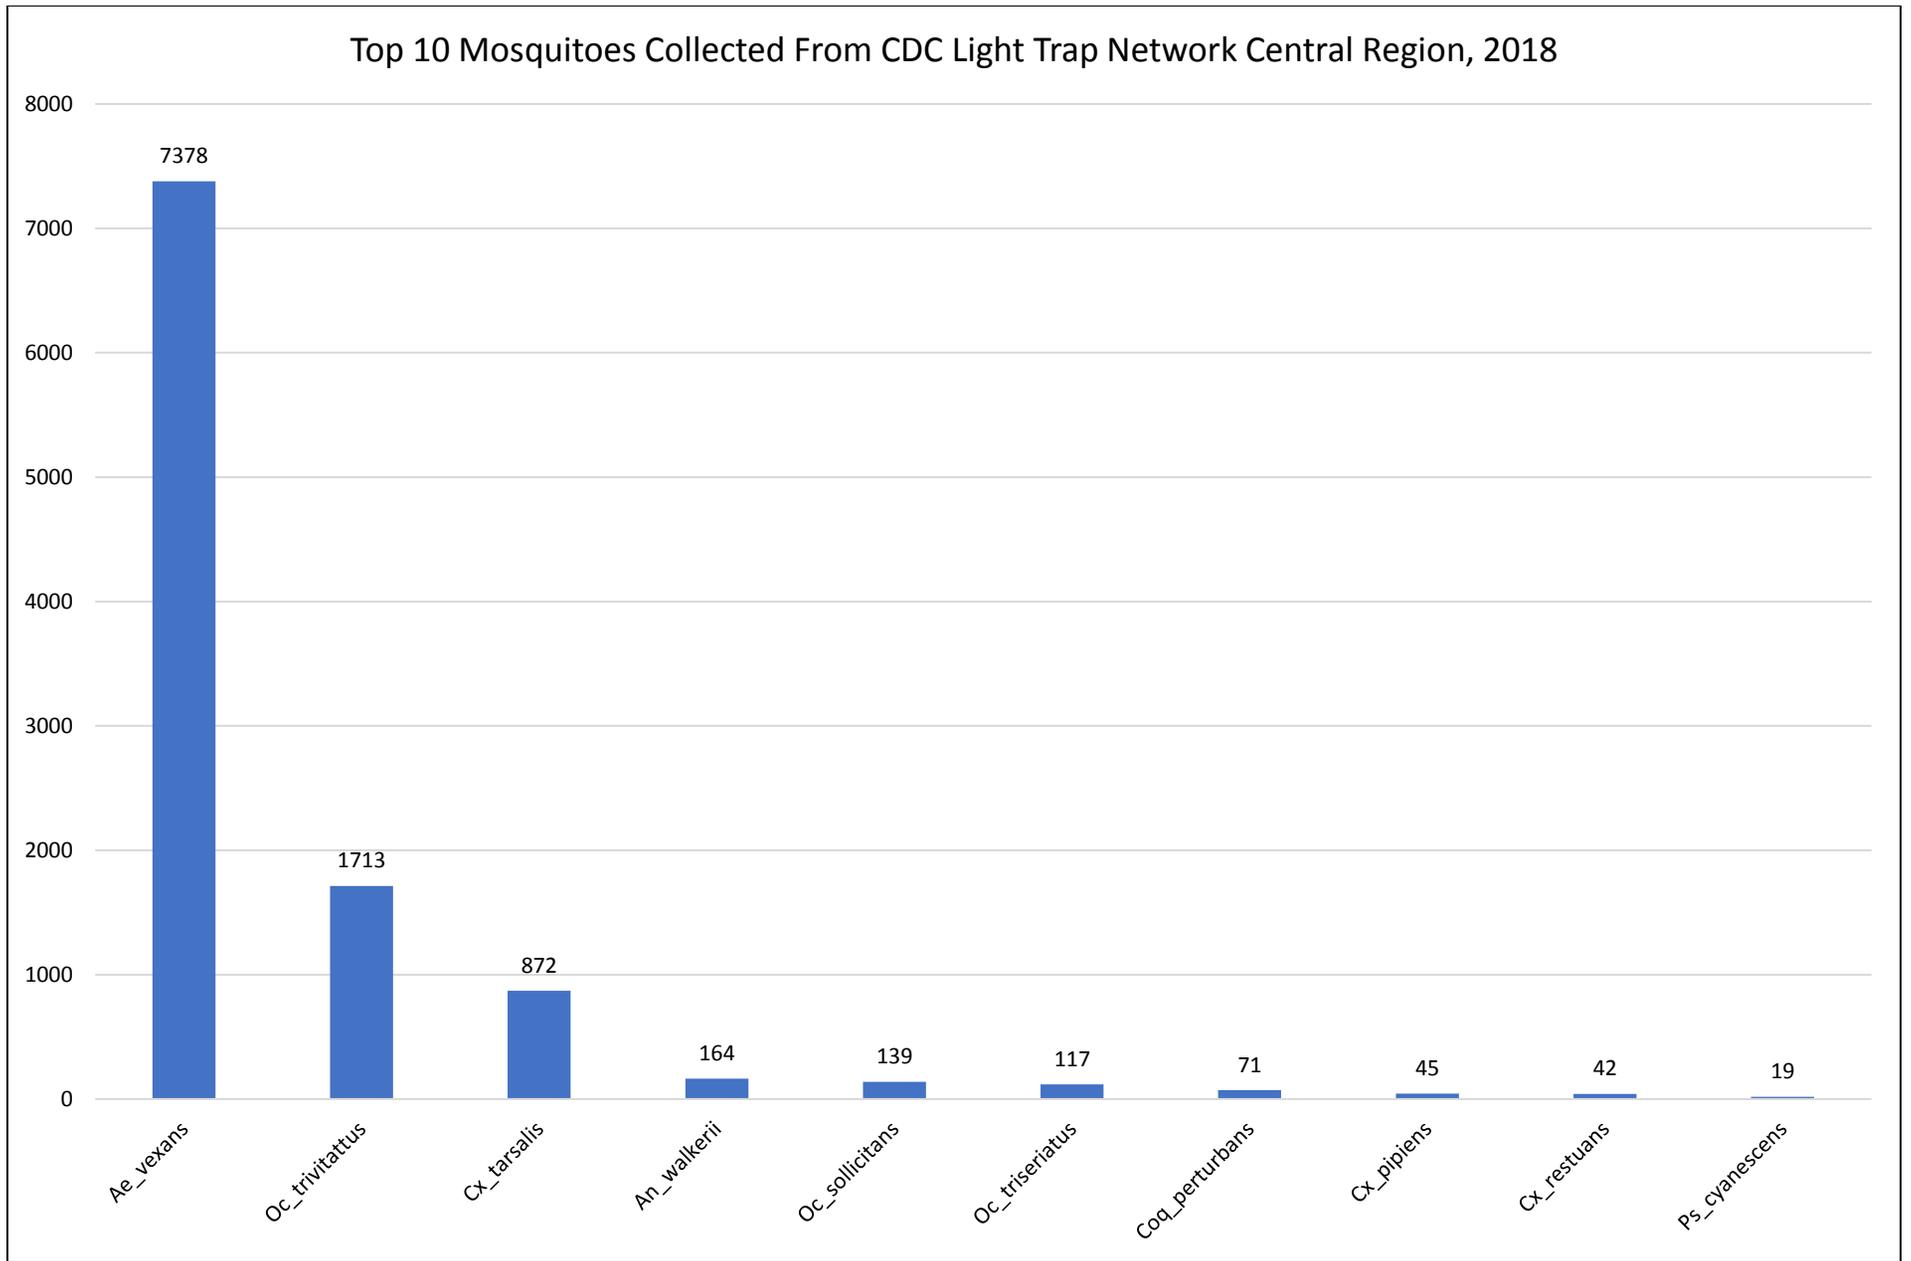

Figure 9. Top 10 cumulative mosquitoes collected in Central region of the state from CDC light trap network, 2018. Note that the first part of the mosquito species name has been abbreviated. Ae= *Aedes*, An= *Anopheles*, Cs= *Culex*, Cx= *Culex*, Oc= *Ochlerotatus*, Ps= *Psorophora*, and Unid'd= Unidentified.

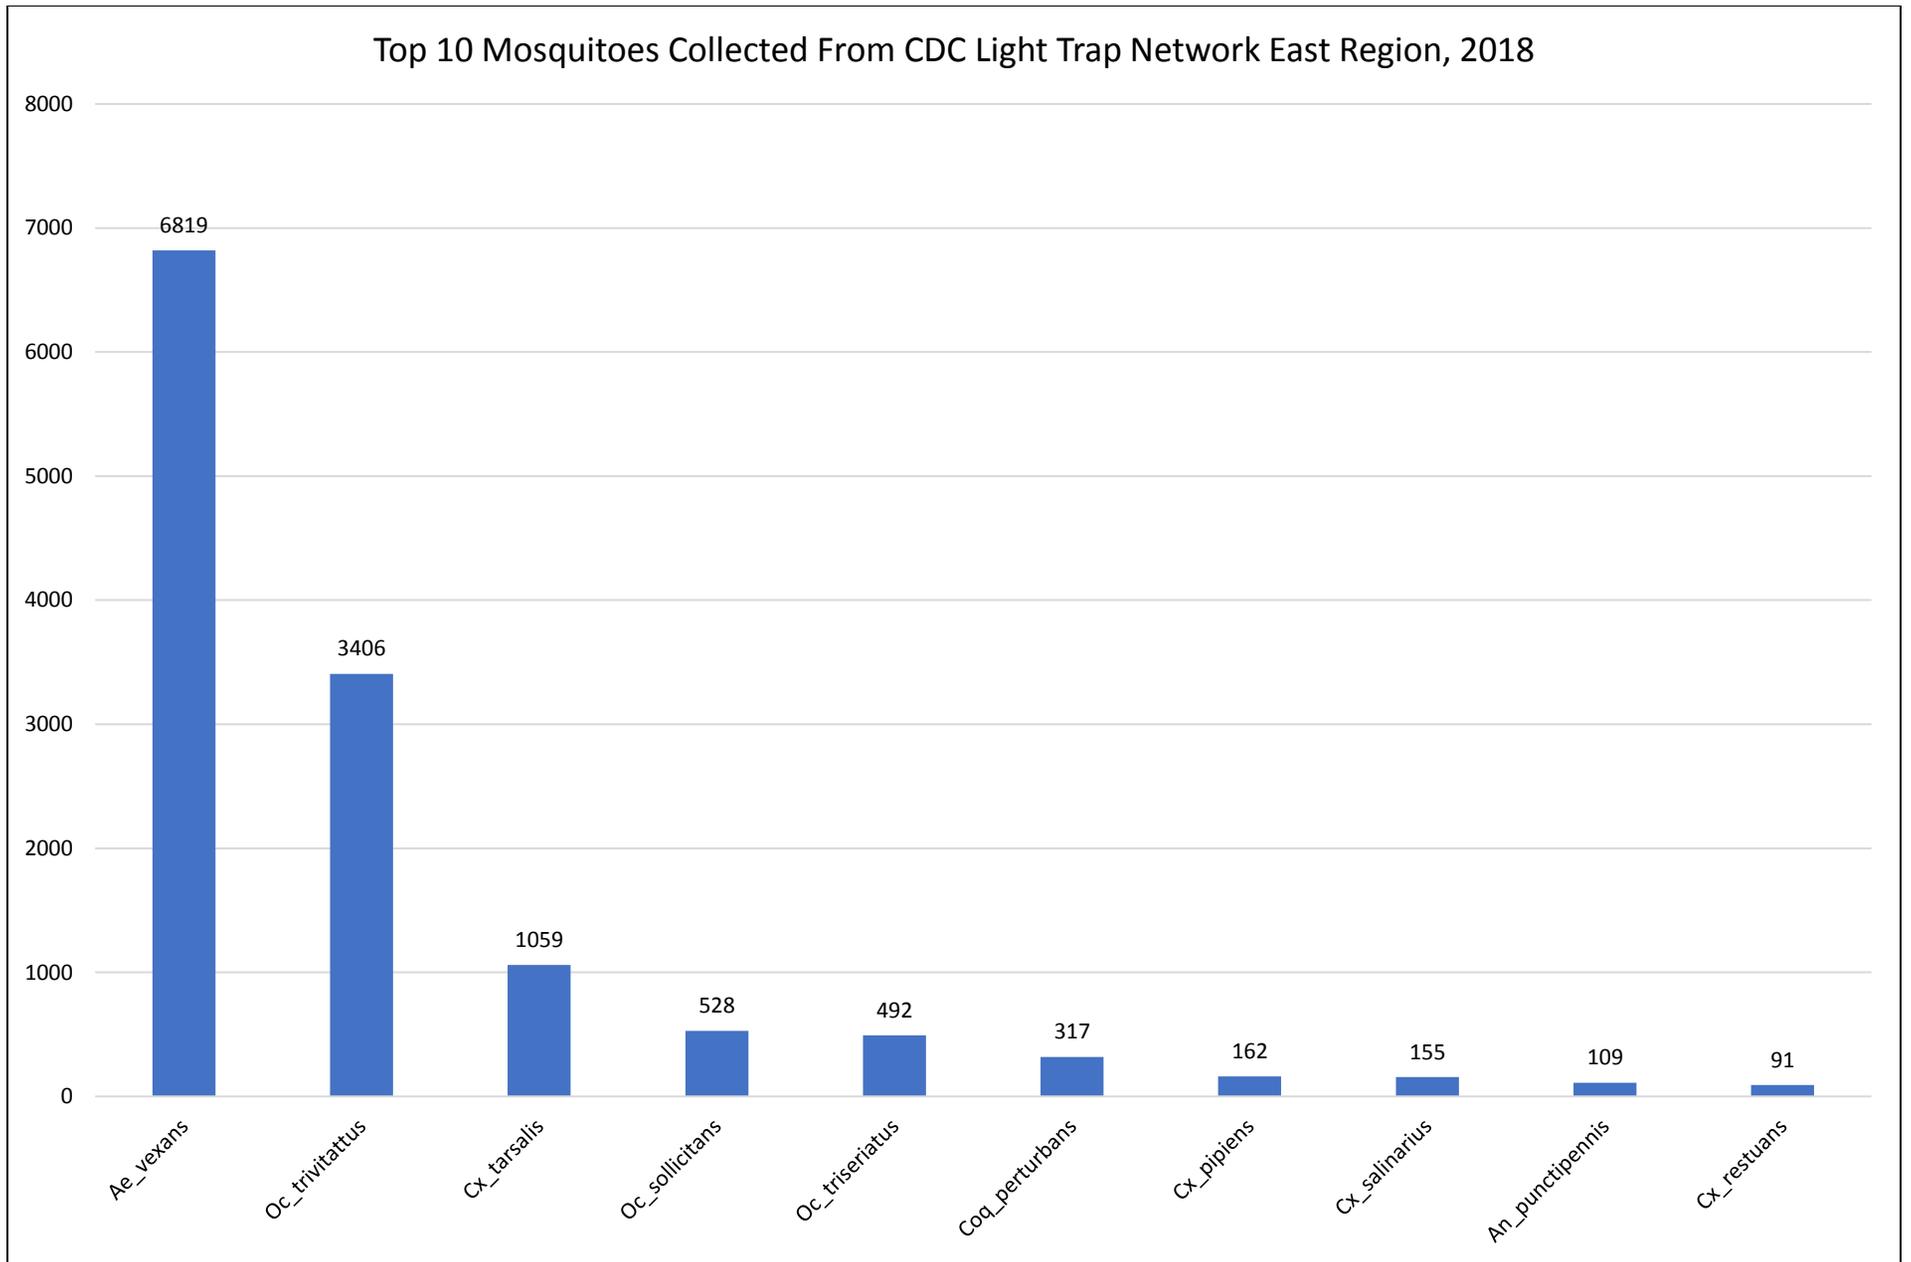

Figure 10. Top 10 cumulative mosquitoes collected in East region of the state from CDC light trap network, 2018. Note that the first part of the mosquito species name has been abbreviated. Ae= *Aedes*, An= *Anopheles*, Cs= *Culesita*, Cx= *Culex*, Oc= *Ochlerotatus*, Ps= *Psorophora*, and Unid'd= Unidentified.

The Nebraska BG Sentinel 2 trap network was established this season to better survey areas of eastern and southeastern Nebraska for the presence of the invasive *Aedes albopictus* (Asian tiger) mosquito. During the mosquito surveillance season, four local health departments will participate in this trap network. This included: Douglas County Health Department, Lincoln-Lancaster Health Department, Sarpy-Cass Department of Health and Wellness, and Southeast District Health Department. For the season, counting all trap sites and types (CDC light and BG sentinel 2) from across the state, a total of 54,385 mosquitoes were captured with 35 (0.006%) *Aedes albopictus* collected.

Table 8. Cumulative Trap Collections in Counties Performing BG Sentinel 2 Trapping, 2018.

County	Trap Type	Total Mosquitoes	Total Culex	Total Ae_albopictus
Cass	CDC Light	NA	NA	NA
	BG Sentinel 2	0	0	0
Cass Co. Overall Total		0	0	0
 				
Douglas	CDC Light	1029	71	0
	BG Sentinel 2	30	6	0
Douglas Co. Overall Total		1059	77	0
 				
Lancaster	CDC Light	1772	218	0
	BG Sentinel 2	28	8	0
Lancaster Co. Overall Total		1800	226	0
 				
Nemaha	CDC Light	NA	NA	NA
	BG Sentinel 2	2	2	0
Nemaha Co. Overall Total		2	2	0
 				
Richardson	CDC Light	611	346	33
	BG Sentinel 2	9	6	2
Richardson Co. Overall Total		620	352	35
 				
Sarpy	CDC Light	NA	NA	NA
	BG Sentinel 2	18	14	0
Sarpy Co. Overall Total		18	14	0
 				
Overall Total		3499	671	35

Note: ND= No data, NA = Not applicable.

Bird and Equine Surveillance

Dead bird reporting: For the season, 49 dead birds have been reported to the Nebraska DHHS dead bird database. Of these, three have met the established criteria for WNV testing, one result has been received (bird was negative), one was unsuitable for testing, and one is pending.

Equine surveillance: For the season no equine WNV case has been reported to the Nebraska DHHS.

Fight the Bite!!
